

Aim: To Build, change, and destroy AWS / GCP /Microsoft Azure/ DigitalOcean infrastructure Using Terraform.
(S3 bucket or Docker) fdp.

Step 1: For this experiment, you need to install docker on your computer. Go to <https://www.docker.com/> and download the file according to the OS you have. Open the file and start the installation.
Once installed, open your terminal and run 'docker' command.
If this is your output, then docker is installed successfully.

```
Microsoft Windows [Version 10.0.22631.3880]

C:\Users\saira>docker

Usage:  docker [OPTIONS] COMMAND

A self-sufficient runtime for containers

Common Commands:
run      Create and run a new container from an image
exec     Execute a command in a running container
ps       List containers
build    Build an image from a Dockerfile
pull     Download an image from a registry
push     Upload an image to a registry
images   List images
login    Log in to a registry
logout   Log out from a registry
search   Search Docker Hub for images
version  Show the Docker version information
info     Display system-wide information

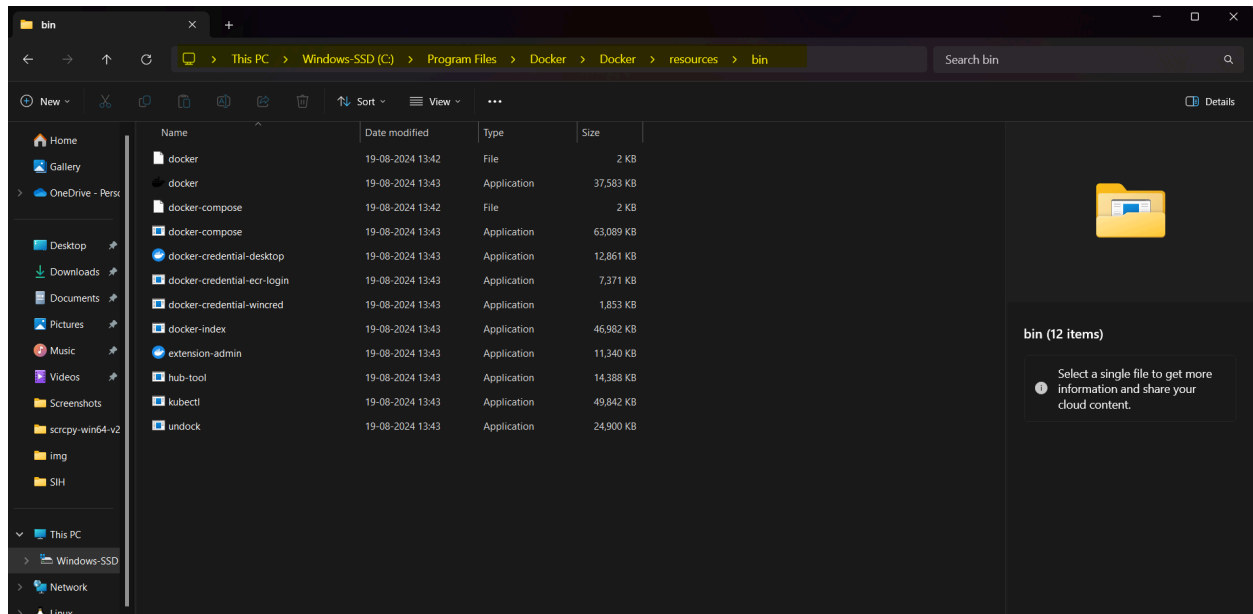

Management Commands:
builder  Manage builds
buildx*  Docker Buildx
compose* Docker Compose
container Manage containers
context  Manage contexts
debug*   Get a shell into any image or container
desktop* Docker Desktop commands (Alpha)
dev*     Docker Dev Environments
extension* Manages Docker extensions
feedback* Provide feedback, right in your terminal!
image    Manage images
init*    Creates Docker-related starter files for your project
manifest Manage Docker image manifests and manifest lists
network  Manage networks
plugin   Manage plugins
sbom*    View the packaged-based Software Bill Of Materials (SBOM) for an image
scout*   Docker Scout
system   Manage Docker
trust    Manage trust on Docker images
volume   Manage volumes

Swarm Commands:
swarm    Manage Swarm

Commands:
attach    Attach local standard input, output, and error streams to a running container
commit    Create a new image from a container's changes
cp        Copy files/folders between a container and the local filesystem
create    Create a new container
diff      Inspect changes to files or directories on a container's filesystem
events     Get real time events from the server
export    Export a container's filesystem as a tar archive
history   Show the history of an image
import    Import the contents from a tarball to create a filesystem image
inspect   Return low-level information on Docker objects
kill      Kill one or more running containers
load      Load an image from a tar archive or STDIN
logs      Fetch the logs of a container
pause     Pause all processes within one or more containers
port      List port mappings or a specific mapping for the container
rename    Rename a container
restart   Restart one or more containers
rm        Remove one or more containers
```

If you get an error like 'docker is not an internal or external command', you need to add the bin path of docker to your environment variables.

Go to File Explorer, and follow this path: C drive → Program Files → Docker → Docker → Resources → bin. Copy this path by clicking on the bar having the path and using shortcut CTRL + C.

Open 'Edit the System Environment Variables' on your system. Click on Environment Variables. Now, check for a 'Path' variable under System variables, if it exists, click on it, then click on edit. Else, click on New and add the variable 'Path'.

If the variable existed, click on Edit, then on New. This will give you a text box. Paste the path you copied here and click on ok until you close all the tabs.

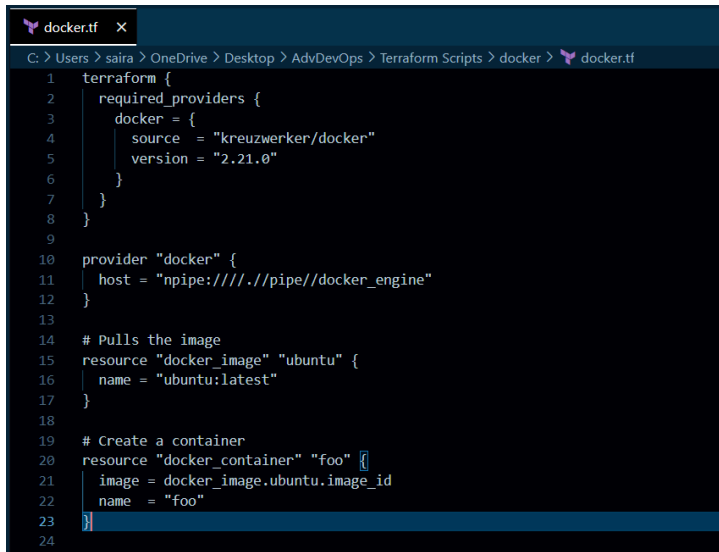

Now run the docker command again and the output would appear.

Alternatively, you could also run 'docker --version' to check whether docker is started on terminal.

```
C:\Users\saira>docker --version
Docker version 27.0.3, build 7d4bcd8
```

Step 2: Create a file called as 'docker.tf'. Open the file and put the following code.

```
terraform {  
  required_providers {  
    docker = {  
      source = "kreuzwerker/docker"  
      version = "2.21.0"  
    }  
  }  
}  
  
provider "docker" {  
  host = "npipe:////./pipe//docker_engine"  
}  
  
# Pulls the image  
resource "docker_image" "ubuntu" {  
  name = "ubuntu:latest"  
}  
  
# Create a container  
resource "docker_container" "foo" {  
  image = docker_image.ubuntu.image_id  
  name = "foo"  
}
```

A screenshot of a code editor window titled 'docker.tf'. The editor shows the Terraform configuration code from the previous block, with line numbers 1 through 24 on the left margin. The code is syntax-highlighted, with keywords in blue, strings in red, and comments in green. The file path in the address bar is 'C:\Users\saira> OneDrive > Desktop > AdvDevOps > Terraform Scripts > docker > docker.tf'.

```
1 terraform {  
2   required_providers {  
3     docker = {  
4       source = "kreuzwerker/docker"  
5       version = "2.21.0"  
6     }  
7   }  
8 }  
9  
10 provider "docker" {  
11   host = "npipe:////./pipe//docker_engine"  
12 }  
13  
14 # Pulls the image  
15 resource "docker_image" "ubuntu" {  
16   name = "ubuntu:latest"  
17 }  
18  
19 # Create a container  
20 resource "docker_container" "foo" {  
21   image = docker_image.ubuntu.image_id  
22   name = "foo"  
23 }  
24
```

Step 3: Open the folder where the docker.tf is present on your terminal. Execute the command 'terraform init'. This will initialize terraform in the directory.

```
C:\Users\saira\OneDrive\Desktop\AdvDevOps\Terraform Scripts\docker>terraform init
Initializing the backend...
Initializing provider plugins...
- Finding kreuzwerker/docker versions matching "2.21.0"...
- Installing kreuzwerker/docker v2.21.0...
- Installed kreuzwerker/docker v2.21.0 (self-signed, key ID BD080C4571C6104C)
Partner and community providers are signed by their developers.
If you'd like to know more about provider signing, you can read about it here:
https://www.terraform.io/docs/cli/plugins/signing.html
Terraform has created a lock file .terraform.lock.hcl to record the provider
selections it made above. Include this file in your version control repository
so that Terraform can guarantee to make the same selections by default when
you run "terraform init" in the future.

Terraform has been successfully initialized!

You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.

If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.
```

Step 4: Run the command 'terraform plan'. This creates an execution plan and lets you overview changes that are going to happen in your infrastructure.

```
C:\Users\saira\OneDrive\Desktop\AdvDevOps\Terraform Scripts\docker>terraform plan

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the
following symbols:
+ create

Terraform will perform the following actions:

# docker_container.foo will be created
+ resource "docker_container" "foo" {
  + attach      = false
  + bridge      = (known after apply)
  + command     = (known after apply)
  + container_logs = (known after apply)
  + entrypoint  = (known after apply)
  + env         = (known after apply)
  + exit_code   = (known after apply)
  + gateway     = (known after apply)
  + hostname    = (known after apply)
  + id          = (known after apply)
  + image       = (known after apply)
  + init        = (known after apply)
  + ip_address  = (known after apply)
  + ip_prefix_length = (known after apply)
  + ipc_mode    = (known after apply)
  + log_driver  = (known after apply)
  + logs        = false
  + must_run    = true
  + name        = "foo"
  + network_data = (known after apply)
  + read_only   = false
  + remove_volumes = true
  + restart     = "no"
  + rm          = false
  + runtime     = (known after apply)
  + security_opts = (known after apply)
  + sha_size    = (known after apply)
  + start       = true
  + stdin_open  = false
  + stop_signal = (known after apply)
  + stop_timeout = (known after apply)
  + tty         = false
  + healthcheck (known after apply)
  + labels (known after apply)
}

# docker_image.ubuntu will be created
+ resource "docker_image" "ubuntu" {
  + id          = (known after apply)
  + image_id    = (known after apply)
  + latest      = (known after apply)
  + name        = "ubuntu:latest"
  + output      = (known after apply)
  + repo_digest = (known after apply)
}

Plan: 2 to add, 0 to change, 0 to destroy.

Note: You didn't use the -out option to save this plan, so Terraform can't guarantee to take exactly these actions if
you run "terraform apply" now.
```

Step 5: Next, run command ‘terraform apply’. This command will carry out the changes that were to be made when ‘terraform plan’ command was executed.

```
Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:
+ create

Terraform will perform the following actions:

# docker_container.foo will be created
+ resource "docker_container" "foo" {
  + attach           = false
  + bridge           = (known after apply)
  + command          = (known after apply)
  + container_logs   = (known after apply)
  + entrypoint       = (known after apply)
  + env              = (known after apply)
  + exit_code        = (known after apply)
  + gateway          = (known after apply)
  + hostname         = (known after apply)
  + id               = (known after apply)
  + image            = (known after apply)
  + init             = (known after apply)
  + ip_address       = (known after apply)
  + ip_prefix_length = (known after apply)
  + ipc_mode         = (known after apply)
  + log_driver       = (known after apply)
  + logs             = false
  + must_run         = true
  + name             = "foo"
  + network_data     = (known after apply)
  + read_only        = false
  + remove_volumes   = true
  + restart          = "no"
  + rm               = false
  + runtime          = (known after apply)
  + security_opts    = (known after apply)
  + shm_size         = (known after apply)
  + start            = true
  + stdin_open       = false
  + stop_signal      = (known after apply)
  + stop_timeout     = (known after apply)
  + tty              = false

  + healthcheck (known after apply)
  + labels (known after apply)
}

# docker_image.ubuntu will be created
+ resource "docker_image" "ubuntu" {
  + id           = (known after apply)
  + image_id     = (known after apply)
  + latest       = (known after apply)
  + name         = "ubuntu:latest"
  + output       = (known after apply)
  + repo_digest = (known after apply)
}

Plan: 2 to add, 0 to change, 0 to destroy.

Do you want to perform these actions?
Terraform will perform the actions described above.
Only 'yes' will be accepted to approve.

Enter a value: yes

docker_image.ubuntu: Creating...
docker_image.ubuntu: Creation complete after 8s [id=sha256:edbfe74c41f8a3501ce542e137cf28ea04dd03e6df8c9d66519b6ad761c2598aubuntu:latest]
docker_container.foo: Creating...

Error: container exited immediately

with docker_container.foo,
on docker.tf line 20, in resource "docker_container" "foo":
```

The script that we are using is going to throw an error.

Error: container exited immediately

This is because the script used is way too small or took a lot less time to execute. To fix this, we add a line to the code. ‘Command = [“sleep”, “infinity”]’.

This line of code lets docker know to keep the program in sleep mode for an infinite amount of time so that the output can be observed rather than stopping after running immediately.

Now rerun the ‘terraform apply’ code. It will ask you to enter yes to execute it. Type yes. The code gets executed and the image is formed.

```
C:\Users\saira\OneDrive\Desktop\AdvDevOps\Terraform Scripts\docker>terraform apply
docker_image.ubuntu: Refreshing state... [id=sha256:edbfe74c41f8a3501ce542e137cf28ea04dd03e6df8c9d66519b6ad761c2598aubuntu:latest]

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:
+ create

Terraform will perform the following actions:

# docker_container.foo will be created
+ resource "docker_container" "foo" {
  + attach      = false
  + bridge      = (known after apply)
  + command     = [
    + "sleep",
    + "infinity",
  ]
  + container_logs = (known after apply)
  + entrypoint    = (known after apply)
  + env          = (known after apply)
  + exit_code     = (known after apply)
  + gateway      = (known after apply)

  + tty           = false

  + healthcheck (known after apply)
  + labels (known after apply)
}

Plan: 1 to add, 0 to change, 0 to destroy.

Do you want to perform these actions?
  Terraform will perform the actions described above.
  Only 'yes' will be accepted to approve.

Enter a value: yes

docker_container.foo: Creating...
docker_container.foo: Creation complete after 1s [id=4baf3d214e59ae23d3cdef4193903a60d94f4d4b0f2ff8c2131891b7a652fca]

Apply complete! Resources: 1 added, 0 changed, 0 destroyed.
```

Using 'docker images' command, you can check the images that are present in docker.

'docker images' before 'terraform apply' is executed

```
C:\Users\saira\OneDrive\Desktop\AdvDevOps\Terraform Scripts\docker>docker images
REPOSITORY    TAG          IMAGE ID      CREATED      SIZE
```

'docker images' command after 'terraform apply' is executed

```
C:\Users\saira\OneDrive\Desktop\AdvDevOps\Terraform Scripts\docker>docker images
REPOSITORY    TAG          IMAGE ID      CREATED      SIZE
ubuntu        latest       edbfe74c41f8  2 weeks ago  78.1MB
```

Step 6: Now that the image is created, we have to destroy it. For this, we use the 'terraform destroy' command. Again, this command will ask for a prompt to enter yes, as a confirmation to destroy the image we created. Type Yes.

```
C:\Users\saira\OneDrive\Desktop\AdvDevOps\Terraform Scripts\docker>terraform destroy
docker_image.ubuntu: Refreshing state... [id=sha256:edbfe74c41f8a3501ce542e137cf28ea04dd03e6df8c9d66519b6ad761c2598aubuntu:latest]
docker_container.foo: Refreshing state... [id=4baf3d214e59ae23d73cdef4193903a60d94f4d4b0f2ff8c2131891b7a652fca]

Terraform used the selected providers to generate the following execution plan. Resource actions are indicated with the following symbols:
- destroy

Terraform will perform the following actions:

# docker_container.foo will be destroyed
- resource "docker_container" "foo" {

}

Plan: 0 to add, 0 to change, 2 to destroy.

Do you really want to destroy all resources?
  Terraform will destroy all your managed infrastructure, as shown above.
  There is no undo. Only 'yes' will be accepted to confirm.

Enter a value: yes

docker_container.foo: Destroying... [id=4baf3d214e59ae23d73cdef4193903a60d94f4d4b0f2ff8c2131891b7a652fca]
docker_container.foo: Destruction complete after 0s
docker_image.ubuntu: Destroying... [id=sha256:edbfe74c41f8a3501ce542e137cf28ea04dd03e6df8c9d66519b6ad761c2598aubuntu:latest]
docker_image.ubuntu: Destruction complete after 0s

Destroy complete! Resources: 2 destroyed.
```

Run the 'docker images' command again to check whether the image is destroyed or not.

```
C:\Users\saira\OneDrive\Desktop\AdvDevOps\Terraform Scripts\docker>docker images
REPOSITORY TAG IMAGE ID CREATED SIZE
```

Thus, we have created an image on docker using terraform and destroyed it.
